

TEMA 3.4

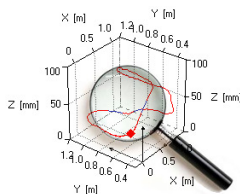

2009-11-05 Image Systems announces TEMA 3.4, the latest release of the world leading software for motion analysis. The following major functionality has been added:

Factory templates. A major step forward in usability and efficiency, TEMA is now shipped with a selection of easy-to-use templates for 2D and 3D applications. The template framework has also been upgraded with more flexibility, e.g. to automatically ask for image files.

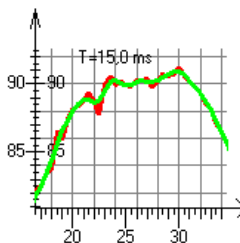

Step track. New toolbar buttons have been added for efficient semi-automatic tracking. A click on step track simply processes one frame and stops. The new buttons make swapping between automatic and step tracking instantaneous, saving a lot of time when tracking image sequences with varying quality.

Presentation – Adjustable aspect ratio and fonts. It is now possible to adjust the aspect ratio of *3D-diagrams* (i.e. zoom individual axes), allowing for detailed visualization of e.g. near-planar and near-linear motion. Also worth a special mention is that *all diagrams* now have settable fonts.

Easy troubleshooting. Saving time and effort for beginners and advanced users alike, a new error message system has been implemented for troubleshooting incorrect test setups.

Smoothing spline. Great for smoothing and interpolating data, smoothing spline functionality has been added to all diagrams. When used, spline curves are fitted to the data in order to make it as smooth as possible without losing information. Cubic, quintic and heptic splines are supported.

... as well as **numerous other new functions, improvements and fixes.** The complete version history can be found on our webpage.
